CHAPTER 1. GENERAL PROPERTIES  
OF A FORTRAN SOURCE PROGRAM

A FORTRAN source program consists of a sequence of FORTRAN *statements*. There are 32 different types of statement, which are described in detail in the chapters which follow.

The following brief program will serve to illustrate the general appearance and some of the properties of a FORTRAN program. It is shown as coded on a standard FORTRAN coding sheet.

LINE NO.	FORTRAN STATEMENT
1	PROGRAM FOR FINDING THE LARGEST VALUE
2	ATTAINED BY A SET OF NUMBERS
3	BIG = A(1)
4	DO 20, I = 2, N
5	IF (BIG - A(I)) 10, 20, 20
10	BIG = A(I)
20	CONTINUE

This program examines the set of  $n$  numbers  $a_i$  ( $i=1, \dots, n$ ) and sets the quantity BIG to the largest value attained in the set. It begins (after a comment describing the program) by setting BIG equal to  $a_1$ . Next the DO statement causes the succeeding statements to and including statement 20 to be carried out repeatedly, first with  $i=2$ , then with  $i=3$ , etc., and finally with  $i=n$ . During each repetition of this loop the IF statement compares  $a_i$  with  $a_1$ ; if BIG is less than  $a_i$ , statement 10, which replaces BIG by  $a_i$ , is executed before continuing.

Each statement is punched on a separate card. If a statement is too long to fit on a single card it can be continued over as many as 9 additional continuation cards. For each statement the initial card must contain either a zero or a blank in column 6; on continuation cards column 6 must not contain a zero or a blank, and it should be used to number the continuation cards consecutively from 1 to 9. If a statement is too long to fit on a single line of the coding form, the programmer can signal to the keypuncher that he has continued on to the next line by placing a mark in the column labeled CONTINUATION.

“... the DO statement causes the succeeding statements to be carried out repeatedly...”

Table 16.1: Standard generic intrinsic procedure summary (cont.)

Procedure	Arguments	Class	Description
REPEAT	(STRING, NCOPIES)	T	Repetitive string concatenation.
RESHAPE	(SOURCE, SHAPE[, PAD, ORDER])	T	Arbitrary shape array construction.
RHSPPACING	(X)	E	Reciprocal of relative spacing of model numbers.
SAME_TYPE_AS	(A, B)	I	Dynamic type equality test.
SCALE	(X, I)	E	Real number scaled by radix power.
SCAN	(STRING, SET [, BACK, KIND])	E	Character set membership search.
SELECTED_CHAR_	(NAME)	T	Character kind selection.
KIND		T	Integer kind selection.
SELECTED_INT_	(R)	T	Real kind selection.
KIND		T	Real kind selection.
SELECTED_REAL_	(P, R, RADIX)	E	Real value with specified exponent.
SET_EXPONENT	(X, I)	E	Shape of an array or a scalar.
SHAPE	(SOURCE [, KIND])	I	Right shift with fill.
SHIFTA	(I, SHIFT)	E	Left shift.
SHIFTL	(I, SHIFT)	E	Right shift.
SHIFTR	(I, SHIFT)	E	Magnitude of A with the sign of B.
SIGN	(A, B)	E	Sine function.
SIN	(X)	E	Hyperbolic sine function.
SINH	(X)	I	Size of an array or one extent.
SIZE	(ARRAY [, DIM, KIND])	E	Spacing of model numbers.
SPACING	(X)	E	Value replicated in a new dimension.
SQUARE	(SOURCE, DIM, NCOPIES)	E	Square root.
SQRT	(X)	T	Indices of stopped images.
STOPPED_IMAGES	(TEAM, KIND)	I	Storage size in bits.
STORAGE_SIZE	(A [, KIND])	T	Array reduced by addition.
SUM	(ARRAY, DIM [, MASK]) or (COUNT, COUNT_RATE, COUNT_MAX)	S	Query system clock.
SYSTEM_CLOCK		E	Tangent function.
TAN	(X)	E	Hyperbolic tangent function.
TANH	(X)	T	Team number.
TEAM_NUMBER	(TEAM)	T	Index of the invoking image.
THIS_IMAGE	(TEAM)	T	Combinator(s) for this image.
THIS_IMAGE	(COARRAY [, TEAM]) or (COARRAY, DIM [, TEAM])	I	Smallest positive model number.
TINY	(X)	E	Number of trailing zero bits.
TRAILZ	(I)	T	Transfer physical representation.
TRANSFER	(SOURCE, MOLD [, SIZE])	T	Transpose of an array of rank two.
TRANSPOSE	(MATRIX)	T	String without trailing blanks.
TRIM	(STRING)	I	Upper bound(s).
UBOUND	(ARRAY [, DIM, KIND])	E	Upper subunit(s) of a coarray.
UCBOUND	(COARRAY [, DIM, KIND])	T	Vector unpacked into an array.
UNPACK	(VECTOR, MASK, FIELD)	E	Character set non-membership search.
VERIFY	(STRING, SET [, BACK, KIND])	E

## Conclusions

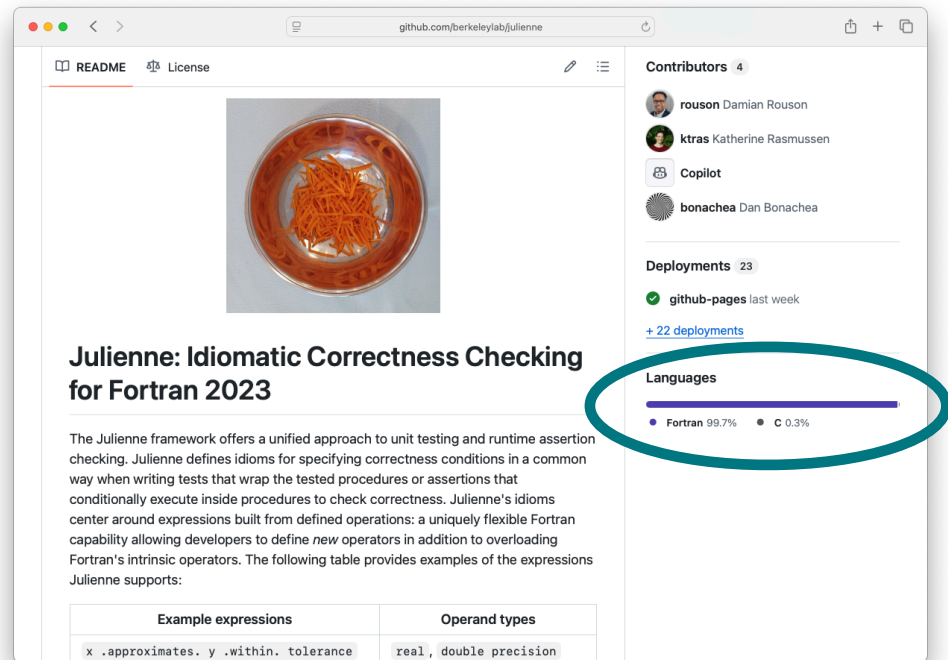

# Correctness-Checking with Julienne

## Unified Idioms for writing

- Unit tests
- Assertions

## Support for Fortran 2023 parallelism

- Multi-image testing: a collective reduction detects failure on a subset of images
- Assertions are pure procedures as required for invocation inside a `do concurrent` construct.

## Elemental Operators:

- Defined as pure functions
- Binary operators accept conformable operands:
  - Same-shaped arrays
  - Scalar/array combinations

Any 1 elemental function defining a binary operator accepts 46 combinations of operands:

- 1 for scalar operands
- 15 for array operands of rank 1-15
- 30 for scalar/array combinations in either order

# Writing PDE Solvers with Formal

## Fortran mimetic abstraction language

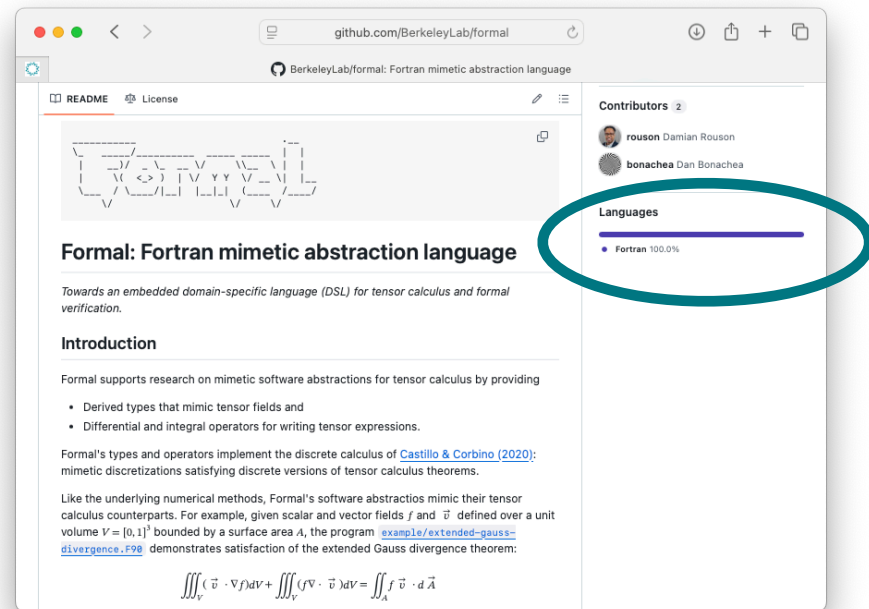

- Derived types that mimic tensor fields
- Differential and integral operators
- Supported by a discrete calculus based on the mimetic discretizations of Corbino & Castillo (2020).

## Future work

- An embedded domain-specific language (DSL) for tensor calculus
- Formal verification leveraging problem-specific proof by testing
- Tensor contractions for machine learning

Corbino, J., & Castillo, J. E. (2020). "High-order mimetic finite-difference operators satisfying the extended Gauss divergence theorem". *Journal of Computational and Applied Mathematics*, 364, 112326.

All

“When writing type-safe templates in Fortran, you can consider the requirements as defining a DSL for the template body. Such DSLs are extremely cheap to define, just a collection of derived declarations, and have no runtime overhead.”

Prof. Magne Haverlaaen  
Bergen Language Design Laboratory  
University of Bergen

```
REQUIREMENT binop(op, T, U, V)
  DEFERRED TYPE :: T, U, V
  DEFERRED INTERFACE
    FUNCTION op(x,y) RESULT(z)
      TYPE(T), INTENT(IN) :: x
      TYPE(U), INTENT(IN) :: y
      TYPE(V) :: z
    END FUNCTION
  END INTERFACE
END REQUIREMENT
```

A requirement encapsulates a reusable relationship among deferred arguments.

The **REQUIRE** statement enforces a REQUIREMENT

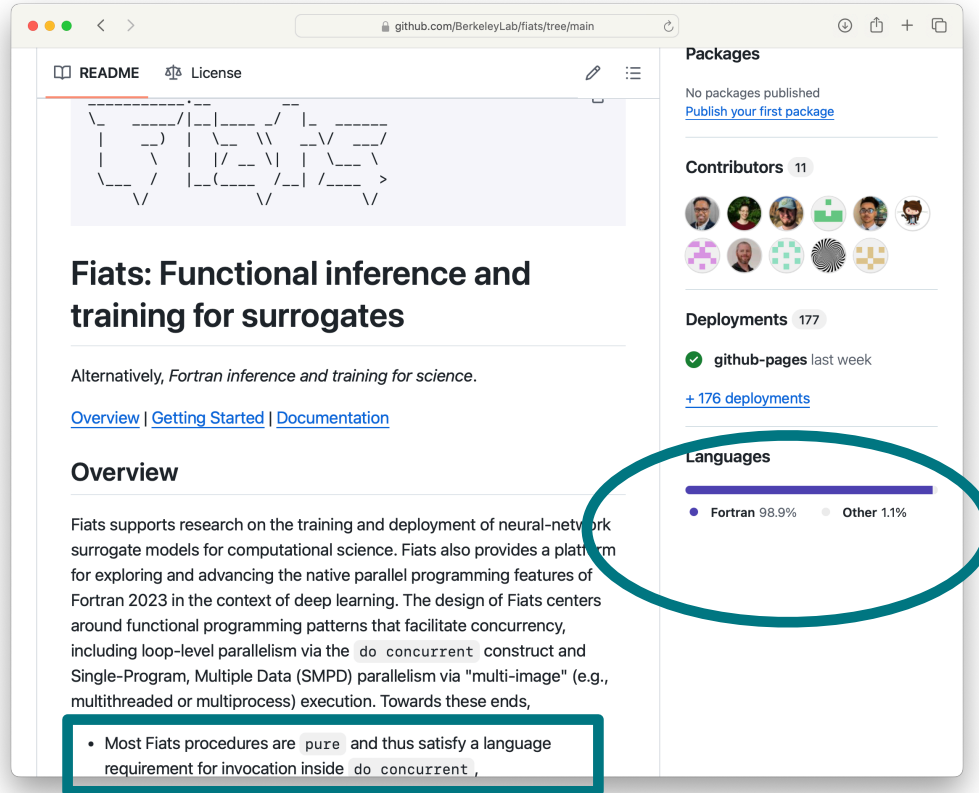

- Mismatch at template instantiation is compile-time error
- Transitively declares its arguments
- Can appear in template specification and requirement construct

```
TEMPLATE my_tmpl(T, U, plus, times)
  USE requirements_mod, only: binop

  REQUIRE binop(plus, T, U, U) ! Real+complex -> complex
  REQUIRE binop(times, T, U, U) ! Real*complex -> complex
  ...
END TEMPLATE
```

**Fiats: Functional inference and training for surrogates**

Alternatively, *Fortran inference and training for science*.

[Overview](#) | [Getting Started](#) | [Documentation](#)

**Overview**

Fiats supports research on the training and deployment of neural-network surrogate models for computational science. Fiats also provides a platform for exploring and advancing the native parallel programming features of Fortran 2023 in the context of deep learning. The design of Fiats centers around functional programming patterns that facilitate concurrency, including loop-level parallelism via the `do concurrent` construct and Single-Program, Multiple Data (SMPD) parallelism via "multi-image" (e.g., multithreaded or multiprocess) execution. Towards these ends,

- Most Fiats procedures are `pure` and thus satisfy a language requirement for invocation inside `do concurrent`.

Applications have evaluated or adopted deep neural networks as surrogate models. At least two categories of solutions have emerged to satisfy the inference and training needs of Fortran applications: (1) application programming interfaces (APIs) that expose functionality provided by software packages written

```
OMP_NUM_THREADS=128 fpm run \  
--example concurrent-inferences \  
--runner "srun --cpu_bind=cores -c 128 -n 1" \  
--network model.json
```

Rouson, Bai, Bonachea, Ergawy, Gutmann, Klemm, Rasmussen, Richardson, Shende, Torres, and Zhang (2025). Automatically parallelizing batch inference on deep neural networks using Fiats and Fortran 2023 “do concurrent”. In *5th International Workshop on Computational Aspects of Deep Learning*, Hamburg, Germany.

```

# Deep Learning with Fiats

```
fiats — vim neural_network_m.f90 — 90x14
21 type neural_network_t(k)
22   !! Encapsulate the information needed to perform inference
23   integer, kind :: k = default_real
24   type(tensor_map_t(k)), private :: input_map_, output_map_
25   type(metadata_t), private :: metadata_
26   real(k), allocatable, private :: weights_(:, :, :), biases_(:, :)
27   integer, allocatable, private :: nodes_(:)
28   type(activation_t), private :: activation_
29 contains
30   generic :: infer => default_real_infer, double_precision_infer
31   procedure, private, non_overridable :: default_real_infer, double_precision_infer
32   generic :: learn => default_real_learn
33   procedure, private, non_overridable :: default_real_learn
```

Kind type parameter allows us to set an object's precision in its declaration *without* recompiling.

`Non_overridable` attribute prevents dynamic dispatch, thereby facilitating *future* GPU execution.

### ABSTRACT

This paper provides an overview of the multi-image parallel features in Fortran 2023 and their implementation in the LLVM Flang compiler and the Caffeine parallel runtime library. The features of interest support a Single-Program, Multiple-Data (SPMD) programming model based on executing multiple "images", each of which is a program instance. The features also support a Partitioned Global Address Space (PGAS) in the form of "coarray" distributed data structures. The paper describes the lowering of multi-image features to the Parallel Runtime Interface for Fortran (PRIF) and the implementation of PRIF in the Caffeine parallel runtime library. This paper also provides an early view into the design of a new multi-image dialect of the LLVM Multi-Level Intermediate Representation (MLIR). We describe the validation and testing of the resulting software stack, and demonstrate that performance compares favorably to another open-source compiler and runtime library: GNU Compiler Collection (GCC) gfortran and OpenCoarrays, respectively.

### CCS CONCEPTS

• Software and its engineering → Runtime environments; Parallel programming languages; • Computing methodologies → Parallel programming languages.

### KEYWORDS

Fortran, Parallel programming, HPC, PGAS, RMA, LLVM Flang, Executable Computing, Runtime Libraries, Caffeine, GASNet-EX

### 1 INTRODUCTION

LLVM [26] provides a highly modular, extensible compilation pipeline, and its maturity for the C and C++ languages is well-established. Following a similar pattern, an effort has been made to focus the Fortran ecosystem [11] and to converge towards an LLVM-based solution, called LLVM Flang [24] (the Fortran front-end of LLVM, denoted flang in the rest of this paper). Flang is under active development and contains robust support for many of the features in Fortran 2023 [15, 25]. However, the latest release (version 21) lacks support for the multi-image parallel features of Fortran. Adding support for these features is on the LLVM roadmap. In 2022, an initial series of patches were integrated to provide the front-end support for multi-image features, but lowering and runtime support remains a work-in-progress. As a consequence, while other prominent Fortran compilers (e.g., GNU gfortran, Intel ifort/xfort, Cray ftn) have production-ready support for a large portion of the multi-image features, this is still missing in Flang.

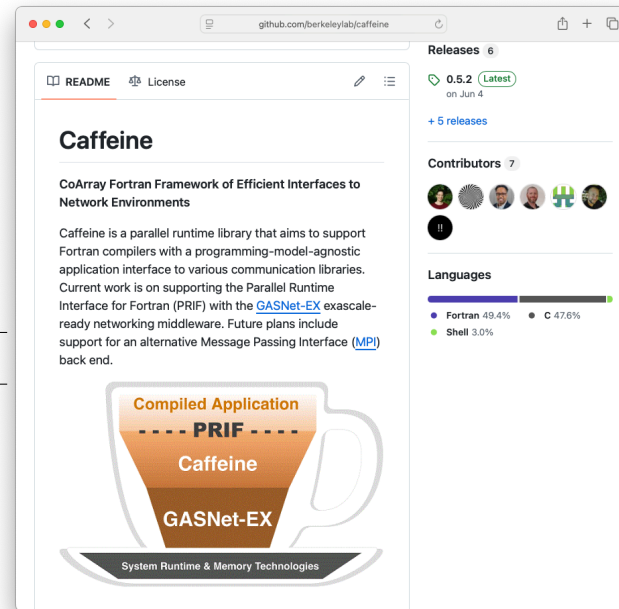

Fortran plays important roles in fields ranging from weather [40] and climate [8] to nuclear energy [10], aerospace engineering [21], and fire protection engineering [27]. If you looked at a weather forecast today, received electricity from a power plant licensed by the U.S. Nuclear Regulatory Commission, rode in any of numerous cars or aircraft models, or live in one of 195 countries that signed the Paris climate accord, then Fortran codes impacted your life in one or more ways today even before you encountered this paper. Teams are also writing Fortran software in emerging disciplines such as deep learning [32] and to develop tools in areas where Fortran has not been typically employed, such as package management [14]. Fortran thus remains a key component in the High-Performance Computing (HPC) software ecosystem [1]. The multi-image features of Fortran allow developers of scientific software to fully utilize the capabilities of HPC systems while still expressing their algorithms in standard Fortran, and increased compiler support for these features will benefit the Fortran developer ecosystem.

<sup>1</sup>We use the term multi-image in this paper to encapsulate coarray features (allocation, deallocation, access, ...) as well as all other multi-image parallel features (synchronization, collective subroutines, atomic subroutines, image teams, etc.).

# Caffeine: Co-Array Fortran Framework of Efficient Interfaces to Network Environments

- Caffeine is written mostly in (serial) Fortran
- Invokes GASNet-EX communication library
- PRIF implementation status:  
[go.lbl.gov/cafeine-status](http://go.lbl.gov/cafeine-status)

Multi-image Fortran Feature	Status
<b>Program startup and shutdown</b> (incl. normal and error termination): STOP, ERROR STOP, END PROGRAM statements	yes
<b>Collective subroutines</b> : CO_{BROADCAST, SUM, MIN, MAX, REDUCE}	yes
<b>Image queries</b> : THIS_IMAGE, NUM_IMAGES, etc, intrinsic functions	yes
<b>Synchronization</b> : SYNC {ALL, IMAGES, MEMORY, TEAM} statements	yes
<b>Storage management</b> : Coarray allocation, deallocation and coarray aliases	yes
<b>Coarray Queries</b> : LCOBOUND, UCBOUND, COSHAPE, etc.	yes
<b>Contiguous and strided coarray access</b> : Coarray puts and gets	yes
<b>Teams</b> : TEAM_TYPE intrinsic type and {FORM, CHANGE, END} TEAM statements	yes
<b>Events</b> : EVENT_TYPE intrinsic type, EVENT_QUERY subroutine and EVENT {POST, WAIT} statements	yes
<b>Notifications</b> : NOTIFY_TYPE intrinsic type and NOTIFY WAIT statement	yes
<b>Atomics</b> : ATOMIC_{INT, LOGICAL}_KIND kind parameters and ATOMIC_{DEFINE, REF, ...} subroutines	yes
<b>Critical construct</b> : CRITICAL and END CRITICAL	no
<b>Locks</b> : LOCK and UNLOCK statements	no
FAIL IMAGE statement	no

*Mostly plants.*

# In Defense of Software: A Developer's Manifesto

*Write software.*

*Not too much.*

*Mostly pure functions.*

# Conclusions

“Fortran [2023] is a new and exciting language used by programmers to communicate with [each other].”

Several underutilized feature sets facilitate writing

- **Compact code:**
  - 46-fold savings in supporting binary operators with elemental functions
  - State-of-the-art neural network training in fewer than 100 lines of code
- **Parallel programs:**
  - Multi-image execution for SPMD/PGAS programming
  - Automatic loop-level multithreading or offloading to a GPU
- **Functional programming patterns:**
  - Pure procedures
  - Immutable state: associate construct
- **Expressive abstractions:**
  - Natural language idioms
  - Textbook forms of partial differential equations
